

Shoe Shop Management System

Project Report

Generated on: 2026-09-26

Project Overview

This project is a React + Vite based shoe shop management application with inventory, billing, product catalog, sales history, QR code generation, and Firebase-backed data persistence. The solution supports store operations for managing products, stock, sales, and customer-facing product information.

Core Features

- Product catalog with add, edit, delete, SKU, barcode, and pricing management
- Inventory tracking and stock adjustments
- Billing and sales module with invoice generation
- QR code generation for stock unit labels
- Authentication and protected routes
- Firebase integration for app data and real-time persistence
- Settings panel with store preferences and theme management

Issues Resolved

1. Route refresh issue on deployment: fixed by adding proper SPA fallback route handling for Vercel / hosting-rewrite requirements.
2. Product save persistence issue: added local fallback storage so new products remain saved even when remote Firebase access is unavailable or restricted.
3. QR scan matching issue: updated scan logic to parse QR payloads and match embedded barcode/unit values correctly.
4. Visual theme update: applied a leather matte premium theme as the default application style.

Verification
